

# Revised diagnostic reference levels in CT imaging: Progress in radiation protection?

Dr. Christoph Aberle, Medical Physicist

KSR Webinar

*Radiation Protection in Medicine*

Friday, 29th January 2021

---

2 projects were funded by the Federal Office of Public Health (FOPH).

People directly involved:

R. Treier<sup>1</sup>, S. Schindera<sup>2</sup>, F. Verdun<sup>3</sup>, A. Viry<sup>3</sup>, D. Racine<sup>3</sup>,  
N. Ryckx<sup>3</sup>, T. Lima<sup>3,4</sup>, C. Aberle<sup>5</sup>

1 Radiological Protection Division, Federal Office of Public Health, Bern, Switzerland

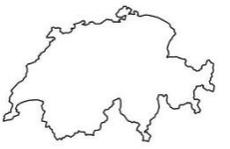

2 Department of Radiology, Kantonsspital Aarau, Aarau, Switzerland

3 Institute of Radiation Physics, Lausanne University Hospital and University of Lausanne, Lausanne, Switzerland

4 Department of Radiology and Nuclear Medicine, Kantonsspital Luzern, Luzern, Switzerland

5 Department of Radiology, University Hospital Basel, University of Basel, Basel, Switzerland

- Introduction
  - Radiation exposure due to CT
  - Diagnostic Reference Levels (DRLs)
- Current Swiss DRLs for CT
- Comparison to previous Swiss DRLs
- Dose and image quality
- Summary

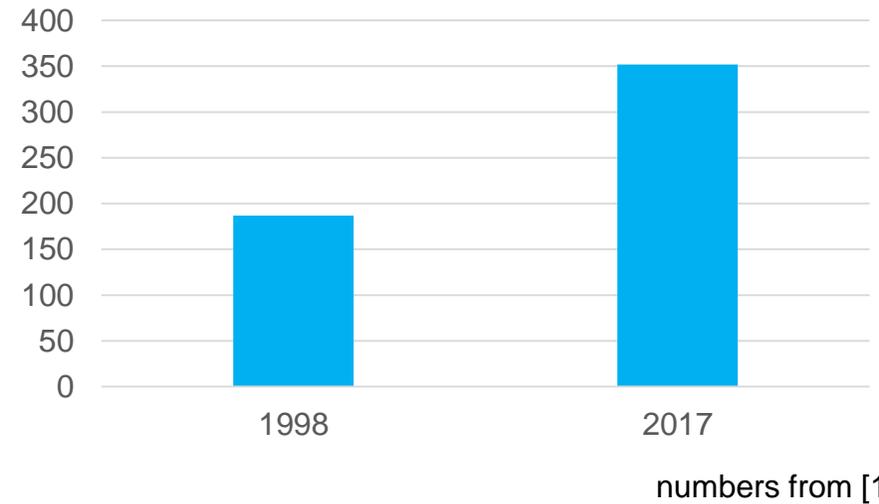

# Introduction

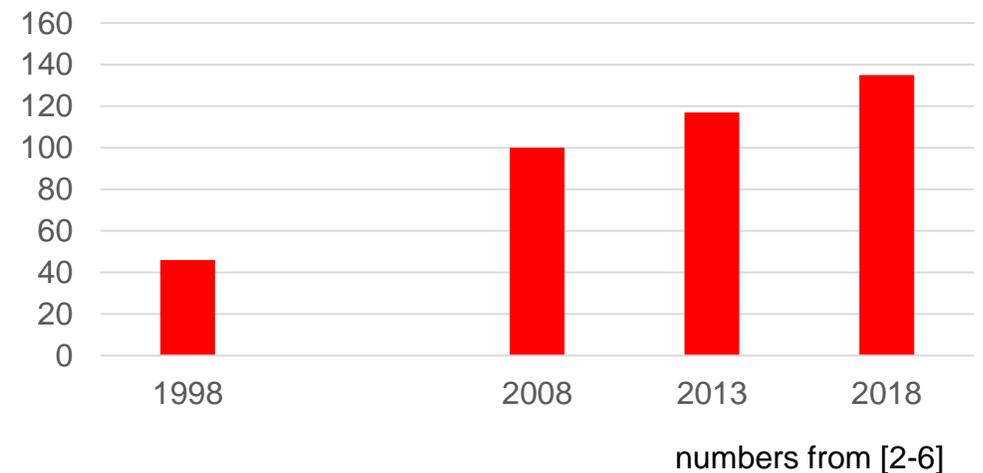

---

- Sharp increase in the number of CT scanners from 1998 to 2017
- Corresponding increase in the number of CT examinations

CT scanners in Switzerland

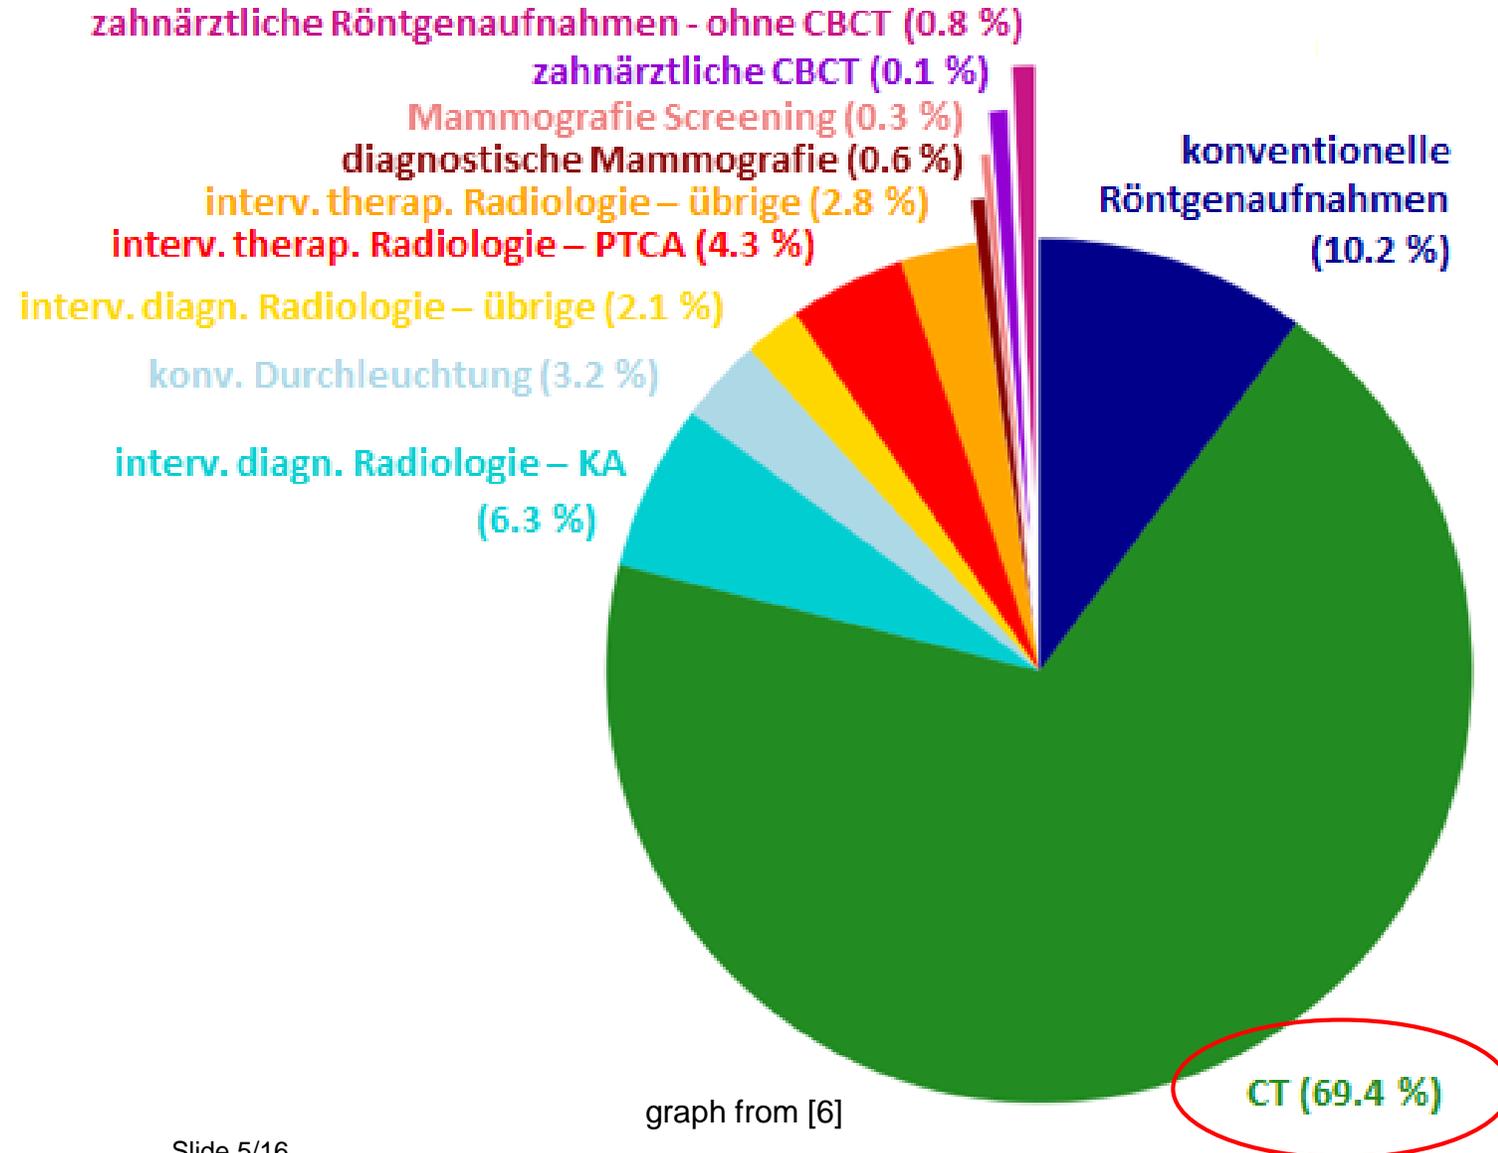

CT examinations per 1'000 inhabitants

# Introduction

- As of 2018, CT contributes **69.4%** to the radiation doses used in radiodiagnostic procedures.
- 0.96 mSv per inhabitant per year due to CT

# Introduction

---

- DRLs are a tool for dose optimization
- The DRL concept is implemented in the RPO

**Art. 35** Diagnostic reference levels

<sup>1</sup> The FOPH shall publish recommendations on radiation doses for diagnostic, interventional or nuclear medicine examinations in the form of diagnostic reference levels.

<sup>2</sup> To this end, it shall conduct national surveys based on the data specified in Article 34 paragraph 2, take international recommendations into account and publish the results.

<sup>3</sup> Licence holders must regularly review their own practices and account for any deviations from diagnostic reference levels.

# Introduction

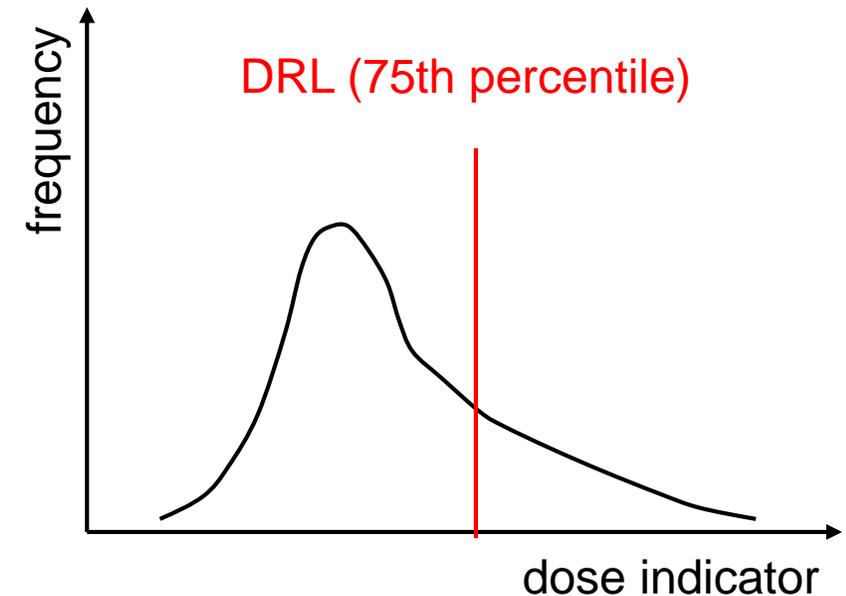

---

## Setting up DRLs:

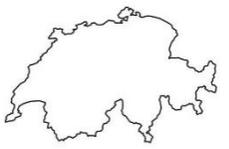

1. Dose distributions ( $CTDI_{vol}$ , DLP) for different examination types are obtained
2. DRLs are set at the 75th percentile

## Application of DRLs:

1. If a DRL is consistently exceeded, investigations have to be performed
2. Dose levels have to be reduced if there is no good reason for elevated doses

# Current Swiss DRLs for CT

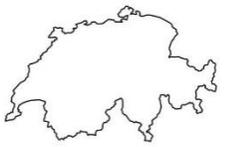

- published by the FOPH in 2018 [7,8]
- 14 participating institutes
- 50 CT scanners
- 5 dose management software tools
- Data from 2014-2017 included

| Institute   | Number of CTs | Dose Management Software |
|---|---------------|--------------------------|
| Centre Hospitalier Universitaire Vaudois (CHUV), Lausanne | 5             | DoseWatch (GE)           |
| Kantonsspital Frauenfeld (KSF), Frauenfeld                | 2             | Radimetrics (Bayer)      |
| Kantonsspital Graubünden (KSGR), Chur                     | 3             | Radimetrics (Bayer)      |
| Universitätsspital Zürich (USZ), Zürich                   | 3             | tqm   DOSE (Agfa)        |
| Kantonsspital Münsterlingen (KSM), Münsterlingen          | 2             | Radimetrics (Bayer)      |
| Universitätsspital Basel (USB), Basel                     | 3             | Radimetrics (Bayer)      |
| Hôpitaux Universitaires de Genève (HUG), Genève           | 7             | Radimetrics (Bayer)      |
| Affidea Schweiz, 5 sites                                  | 5             | DoseWatch (GE)           |
| Privatklinikgruppe Hirslanden, 9 sites                    | 10            | DoseM (INFINITT)         |
| Stadtspital Triemli, Zürich                               | 2             | DoseWatch (GE)           |
| Kantonsspital Aarau (KSA), Aarau                          | 3             | in-house solution        |
| Merian Iselin Klinik, Basel                               | 1             | Radimetrics (Bayer)      |
| Kantonsspital Baselland (KSBL), 3 sites                   | 3             | Radimetrics (Bayer)      |
| Felix-Platter-Spital (FPS), Basel                         | 1             | Radimetrics (Bayer)      |

data from [8]

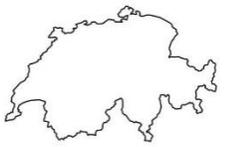

# Current Swiss DRLs for CT

| Anatomical region    | Master protocol (depending on clinical indication) |                                    |
|----------------------|--|------------------------------------|
| Head                 | Head   | } Head phantom<br>(16 cm diameter) |
|                      | Facial Bones / Sinuses                             |                                    |
|                      | Low Dose Sinuses (Sinusitis)                       |                                    |
| Neck                 | Neck   | } Body phantom<br>(32 cm diameter) |
|                      | CT Angiography (Carotid Angio)                     |                                    |

Round brackets: values relative to the previous DRLs

data from [8,10]

# Dose and image quality

---

- DRLs don't measure image quality
- There is the possibility of excessive dose reduction
- If local dose values are below the 25th percentile, image quality should be considered the first priority for further optimization
- Optimization might also mean increasing the dose in some cases
- The goal is standardization of image quality

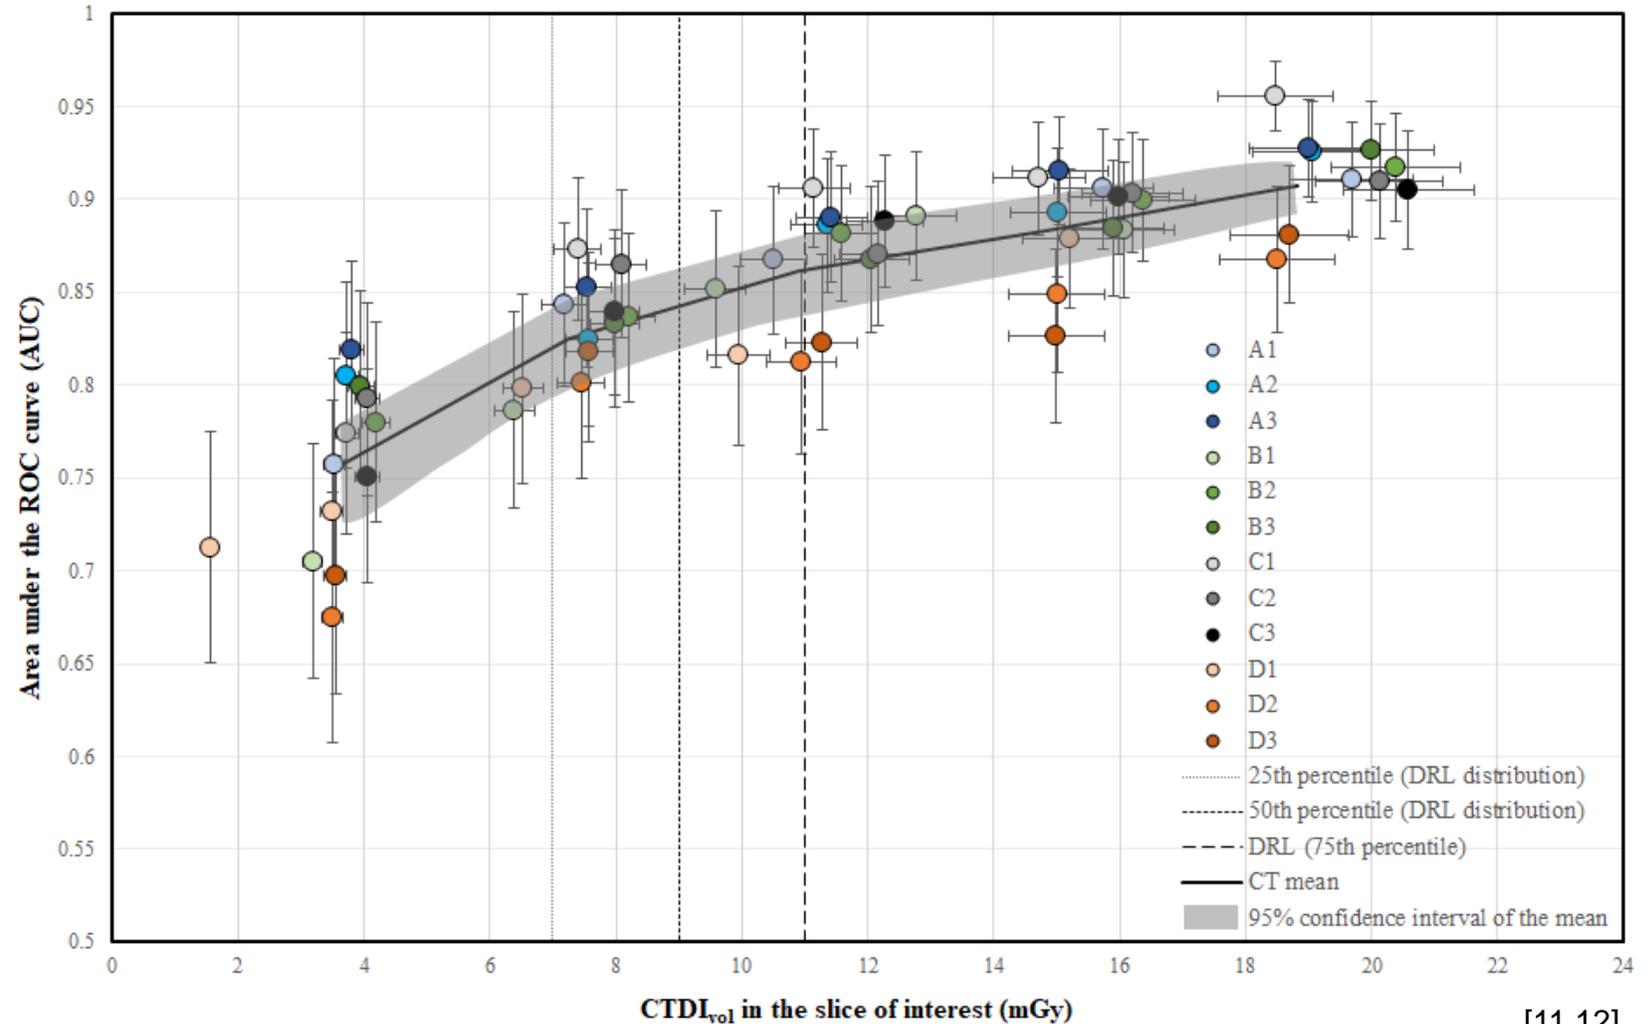

# Dose and image quality

Follow-up project to study the link of DRLs to image quality:

- mathematical model observer phantom study
- The graph shows an example for low contrast lesion detection (5 mm diameter spheres with 20 HU contrast in a phantom)

→ Image quality is not very high around the DRL and it does not reach a plateau in the clinically relevant dose range

→ There is a need for specific dose optimization for each CT scanner

[11,12]

# Summary

---

- Swiss DRLs for adult CT were updated in 2018
- There was a substantial average reduction of DRLs compared to 2010 due to new CT technology and optimization efforts.
- Average DRL reduction compared to 2010 by 30% for CTDI<sub>vol</sub> and 22% for DLP
- Dose optimization is not always dose reduction, image quality has to be standardized
